(\$4) Title: WEAVING DEVICE

2610 A1

(57) Abstract: The invention relates to a weaving device comprising means for forming a shed consisting of warp yarms, with insertion means being dispused on one side or on both sides of the shed for inserting a west yarm into the shed. The object of the invention is to provide a weaving device as referred to in the introduction, which weaving device is of significantly simplified construction and which is much simpler to control. According to the invention, the weaving device is to that end characterized in that the west yarm has been some into a packed clow, which packed clow unwinds into an elongated west yarm upon insertion into the shed. These aspects obviate the need to use a projectile having a high inert mass and the related insertion means and braking means for moving and decelerating the movement of the projectile through the shed, resulting in a weaving device of significantly simplified construction, which is much simpler to control and which can be operated at a much higher rate.
